Problem Record - Northstar Checkout

Lifecycle status

Investigating - evidence synthesis completed; corrective actions proposed.

Impact

3 repeat incidents; peak latency 880 ms; 695 affected orders.

Evidence

- 3 incidents reference valid change records.
- Peak latency followed change CHG-34.
- Dependency version drift is a supported contributor; sole root cause remains a hypothesis pending controlled reproduction.

Recommendations

- Prevent: Pin and verify dependency versions before merge - Platform team; verify: Zero unpinned production dependencies
- Detect: Alert on sustained latency plus change correlation - SRE team; verify: Two consecutive windows; false positive below 5%
- Recover: Automate safe rollback when canary SLO is breached - Checkout team; verify: Recovery below 30 minutes in game day

Review

Review on 2026-09-20 using repeat-incident count, false-positive rate and recovery time.
