DevOps Foundation Training - R Labs

Course code: TGS-2024049184 Version: v4.0

Eight connected, self-contained labs turn DevOps problem-management concepts into reproducible evidence. Follow them in order; Lab 08 is the capstone.

Lab 01 - Build an Incident-to-Problem Lifecycle Baseline in R

Apply K1 and A1 by managing a supplied incident dataset through detection, logging, investigation, resolution and learning states.

Lab 02 - Detect Actionable Service Signals in R

Apply K2 and A2 by designing an automated detection rule that produces specific, severity-ranked problem signals without excessive noise.

Lab 03 - Investigate Recurring Failure Causes with Pareto Analysis

Apply K2 and A2 while preparing evidence for A3: distinguish symptoms from cause candidates and identify recurring categories worth deeper investigation.

Lab 04 - Prioritise Problems by Severity, Frequency and Impact

Apply K3 and A3 by defining evidence, then K4 and A4 by applying a transparent prioritisation rule.

Lab 05 - Diagnose Pipeline Flow and Cultural Debt

Apply K4 and A4 by combining stage performance with visible queue and rework evidence to recommend a prioritised improvement.

Lab 06 - Balance Reliability, Security and Delivery Guardrails

Apply K4 and A4 by categorising reliability and security risks, then selecting proportional automated guardrails.

Lab 07 - Build a DORA and Problem-Management Evidence Dashboard

Apply K5 and A6 by calculating documented delivery metrics and linking them to tracked problem-management actions.

Lab 08 - Capstone - Produce a Verified DevOps Problem Recommendation

Apply A1-A6 in one connected case: manage the lifecycle, analyse root cause, prioritise, recommend controls and create monitorable documentation.
